

Force.com Source Scanner Results

Job Type: ZIP_UPLOAD

Preset: PortalAll

Scan Id: a0OKX000001JLyY2AW

Description: CloudScan

Email Address: popcrabadmins@salesforce.com

Security Issues: 17

Service Version: v3.2

Scan Start: 2026-07-07 14:22:23

Quality Issues: 0

CxEngine: 9.7

Scan End: 2026-07-07 19:28:35

Multiple Trigger On same sObject	Apex Code Quality	No Issues Found
Queries With No Where Or Limit Clause	Apex Code Quality	No Issues Found

Test Methods With No Assert	Apex Code Quality	No Issues Found
SOSL SOQL Statments Inside Loops	Apex Code Quality	No Issues Found

Query: Stored XSS

A cross-site scripting weakness occurs when dynamically generated web pages display unvalidated, unfiltered, and unencoded user input allowing an attacker to embed malicious scripts into the generated page. This can be leveraged to execute scripting code as if it came from the site's server on the computer of anyone who uses the site. This may be a false positive if the datatype is safe to render unescaped (such as an integer or rich text field).

Object: body_text_block_3__c in file:
components/Section_Component.component

```
L 336: <apex:outputtext style="white-space: pre" value="{!section.
```

Query: Apex CSRF Aura LWC

Cross-site request forgery (also known as CSRF or XSRF). The web does not and cannot sufficiently verify whether a well-formed, valid, consistent request was intentionally provided by the user who submitted the request. In effect, when a server receives a request it has no ability to determine whether that was initiated by a valid user or an attacker, leading to potential escalation of privilege attacks. This issue may be a false positive if the intention of your code is to allow unauthenticated DML operations (for example a web2case service). In Aura components, "init" sections are executed on page load and could lead to CSRF if DML operations are performed in Apex on page load.
